Questioning Design of Interdisciplinary Education

As society becomes more complex, engineering problems become more wicked and complex. One of the solutions is to work in teams with members of different disciplinary backgrounds.

But what does it mean to work interdisciplinary? What makes education interdisciplinary and in which ways can we design interdisciplinary education?

These questions are addressed in the lecture with two research based examples.

Dr. Renate Klaassen

has worked at TU Delft since 1997. She currently performs two roles at the university: Programme Co-ordinator/Researcher for 4TU Centre for Engineering Education at TU Delft. In 2001, Renate graduated as a Doctor from TU Delft, specialising in English medium instruction in higher education. She has been heavily involved in advising on the educational innovation of the BSc programme in Aerospace Engineering as well as various other curriculum reforms at TU Delft.
